

BallastLane Clean Architecture

The backend follows Clean Architecture with four layers:

Domain - Entities, value objects, domain rules. No external dependencies.

Application - Use cases, DTOs, service interfaces. Depends only on Domain.

Infrastructure - ADO.NET repositories, JWT, LLM clients, RAG indexing. Implements Application interfaces.

API - ASP.NET Core controllers, middleware, configuration. Thin orchestration only.

Dependency direction: API -> Application <- Infrastructure. Domain has no inward dependencies.

Business logic lives in Domain and Application services. Controllers never contain business rules.
